

**Advancing MR Science and Technology for Improved Health/Multimodality Imaging in Cancer:  
Meeting Unmet Clinical Needs**

Jay P. Heiken, MD      [heikenj@mir.wustl.edu](mailto:heikenj@mir.wustl.edu)

**Highlights**

- MR imaging has advantages relative to CT in characterizing cystic abdominal lesions
- Multi-parametric evaluation is essential for characterizing cystic abdominal lesions
- Diffusion weighted imaging can be helpful but has limitations in enabling differentiation between benign and malignant cystic lesions

**Title:** Characterization of Cystic Abdominal Lesions

**Target audience:** Radiologists, oncologists and support scientists

**OUTCOME/Objectives:** Learners will be able to identify imaging findings helpful in characterizing cystic abdominal lesions
